

House Husaro: Wall-Floor to Foundation Section Detail
Diamone Cromer

This section illustrates the wall-floor-to-foundation connection of House Husarö, focusing on improved thermal and moisture performance. Continuous rigid insulation, vapor barriers, and batt insulation reduce heat loss while maintaining the lightweight wood-frame construction of the house. A drainage mat and gravel layer below the foundation manage runoff and protect against frost buildup. Together, these updates enhance the home's passive heating capacity, energy efficiency, and year-round comfort within the island's cold Nordic climate.
